1 Basic definitions

1.1 Categories

Definition 1.1.1 (Category)**.** A catgeory $\mathcal{C}$ contains the following data:

1. a *collection* of objects, $\mathrm{Ob}(\mathcal{C})$,

2. for every $x, y \in \mathrm{Ob}(\mathcal{C})$ a collection of morphisms $\mathrm{Hom}_{\mathcal{C}}(x, y)$ from x to y,

3. an identity morphism $\mathrm{id}_x \in \mathrm{Hom}_{\mathcal{C}}(x, x)$ for all $x \in \mathrm{Ob}(\mathcal{C})$,

4. a composition map of morphisms, $\circ : \mathrm{Hom}_{\mathcal{C}}(y, z) \times \mathrm{Hom}_{\mathcal{C}}(x, y) \to \mathrm{Hom}_{\mathcal{C}}(x, z)$ for all $x, y, z \in \mathrm{Ob}(\mathcal{C})$.

Which satisfy the two axioms:

1. for all $f \in \mathrm{Hom}_{\mathcal{C}}(x, y)$ with $x, y \in \mathrm{Ob}(\mathcal{C})$ we have $f \circ \mathrm{id}_x = f = \mathrm{id}_y \circ f$,

2. for compatible morphisms f, g, h we have $f \circ (g \circ h) = (f \circ g) \circ h$.

We will use the shorthand $x \in \mathcal{C}$ for $x \in \mathrm{Ob}\,\mathcal{C}$, $\mathrm{Hom}(x, y)$ for $\mathrm{Hom}_{\mathcal{C}}(x, y)$ when $\mathcal{C}$ is obvious and $\mathrm{End}(x)$ for $\mathrm{Hom}(x, x)$.

Note 1.1.2. Note that in our definition the term *collection* is used instead of set, this is commonplace and necessary to prevent paradoxes when constructing the category of sets.

Examples 1.1.3. The following are all categories:

1. Set with sets as objects and functions as their morphisms,

2. Grp with groups as objects and their homomorphisms as morphisms,

3. Ab, Grp restricted to abelian groups,

4. for a field k, Vect_k with k-vector spaces as objects and linear transformations as morphisms,

5. Cat with categories as objects and soon to be defined **functors** as morphisms,

6. Top, Rng, Meas, Poset, Man with their objects and morphisms all defined similarly

7. Given a category $\mathcal{C}$, $\mathcal{C}^{op}$ wich has the same opjects as $\mathcal{C}$ but $\mathrm{Hom}_{\mathcal{C}^{op}}(x, y) = \mathrm{Hom}_{\mathcal{C}}(y, x)$ for all $x, y \in \mathcal{C}$,

8. Any set X with objects as elements in X and no morphisms except the identities

9. $(\mathbb{R}, \leq)$ with objects as $\mathbb{R}$ and a morphisms from x to y iff $x \leq y$ for all $x, y \in \mathbb{R}$.

Definition 1.1.4 (Isomorphism)**.** A morphism $f \in \mathrm{Hom}(x, y)$ is an **isomorphism** iff there is a morphism $f^{-1} \in \mathrm{Hom}(y, x)$ with $f \circ f^{-1} = \mathrm{id}_y$ and $f^{-1} \circ f = \mathrm{id}_x$.

1.2 Functors

Definition 1.2.1 ((Covariant) Functor)**.** Given categories $\mathcal{C}, \mathcal{D}$ a **(covariant) functor** $F : \mathcal{C} \to \mathcal{D}$ is the following data:

1. a map $\mathrm{Ob}(\mathcal{C}) \to \mathrm{Ob}(\mathcal{D})$ (also denoted F),

2. for any two objects $x, y \in \mathcal{C}$ a map $\mathrm{Hom}_{\mathcal{C}}(x, y) \to \mathrm{Hom}_{\mathcal{D}}(F(x), F(y))$ (also also denoted F)

satisfying the properties:

1. for all $x \in \mathcal{C}$, $F(\mathrm{id}_x) = \mathrm{id}_{F(x)}$,

2. for all x, y, z with f, g in $\mathrm{Hom}_{\mathcal{C}}(y, z), \mathrm{Hom}_{\mathcal{C}}(x, y)$, $F(f \circ g) = F(f) \circ F(g)$.

Definition 1.2.2 (Contravariant functor)**.** A **contravariant functor** from $\mathcal{C}$ to $\mathcal{D}$ is a covariant functor from $\mathcal{C}^{op}$ to $\mathcal{D}$.

Definition 1.2.3 (Full)**.** A functor $F : \mathcal{C} \to \mathcal{D}$ is **full** if the map

1.3   Natural transformations

Definition 1.3.1 (Natural transformation)**.** Given categories $\mathcal{C}, \mathcal{D}$ with functors $F, G : \mathcal{C} \to \mathcal{D}$, a **natural transformation** $\eta : F \to G$ consists of morphisms η_x for all $x \in \mathcal{C}$ such that the diagram,

$$
\begin{array}{ccc}
F(x) & \xrightarrow{F(f)} & F(y) \\
\downarrow{\eta_x} & & \downarrow{\eta_y} \\
G(x) & \xrightarrow{G(f)} & G(y)
\end{array}
$$

commutes for all $x, y \in \mathcal{C}$ and $f \in \operatorname{Hom}_{\mathcal{C}}(x, y)$.

Remark 1.3.2. By constructing the category of functors from $\mathcal{C}$ to $\mathcal{D}$, denoted $\operatorname{Fun}(\mathcal{C}, \mathcal{D})$, morphisms are natural transformations. **Natural isomorphisms** are defined as isomorphisms in this category.

1.4   Equivalence of categories

Definition 1.4.1 (Equivalence)**.** Given categories $\mathcal{C}, \mathcal{D}$ an **equivalence of categories** is a pair of functors $F : \mathcal{C} \to \mathcal{D}$ and $G : \mathcal{D} \to \mathcal{C}$ with natural isomorphisms $FG \xrightarrow{\sim} \operatorname{id}_{\mathcal{D}}$ and $\operatorname{id}_{\mathcal{C}} \xrightarrow{\sim} GF$.

Definition 1.4.2 (Adjunction)**.** An **adjuction** between categories $\mathcal{C}, \mathcal{D}$ is a pair of functors $F : \mathcal{C} \to \mathcal{D}$ and $G : \mathcal{D} \to \mathcal{C}$ such that for all $x \in \mathcal{C}$ and $y \in \mathcal{D}$, there exists an $\eta_{x,y} : \operatorname{Hom}_{\mathcal{C}}(x, G(y)) \xrightarrow{\sim} \operatorname{Hom}_{\mathcal{D}}(F(x), y)$ such that the diagram

$$
\begin{array}{ccccc}
\operatorname{Hom}_{\mathcal{D}}(F(x'), y) & \xrightarrow{\circ F(f)} & \operatorname{Hom}_{\mathcal{D}}(F(x), y) & \xrightarrow{g\circ} & \operatorname{Hom}_{\mathcal{D}}(F(x), y') \\
\uparrow{\eta_{x',y}} & & \uparrow{\eta_{x,y}} & & \uparrow{\eta_{x,y'}} \\
\operatorname{Hom}_{\mathcal{C}}(x', G(y)) & \xrightarrow{\circ f} & \operatorname{Hom}_{\mathcal{C}}(x, G(y)) & \xrightarrow{G(g)\circ} & \operatorname{Hom}_{\mathcal{C}}(x, G(y'))
\end{array}
$$

commutes for all $x, x' \in \mathcal{C}$; $y, y' \in \mathcal{D}$; $f : x \to x'$ and $g : y \to y'$.

Theorem 1.4.3. If F, G form an equivalence of the categories $\mathcal{C}, \mathcal{D}$ then F, G are an adjunction.
